## Problem 1

A *strongly independent set* is a subset of vertices  $S$  in a graph  $G$  such that for any two vertices in  $S$ , there is no path of length two in  $G$ . Prove that *Strongly Independent Set* is NP-hard.

## Solution

We reduce the *strongly independent set* problem to the *independent set* problem.

*Reduction.* For an arbitrary *undirected* graph  $G = (V, E)$ , we construct a new *undirected* graph  $G'$  by

- adding a new vertex on every edge of  $G$ , and
- connecting two "edge" vertices if the edges share a common vertex.

Formally,

$$\begin{aligned} G' &= (V', E'), \text{ where} \\ V' &= V \cup \{v_{ij} \mid (i, j) \in E\} \\ E' &= \{(i, v_{ij}), (j, v_{ij}) \mid (i, j) \in E\} \cup \{(v_{ik}, v_{jk}) \mid (i, k), (j, k) \in E\} \end{aligned}$$

We claim that  $G$  has an *independent set* if and only if  $G'$  has a *strongly independent set*.

---

*If.* Suppose  $G$  has an *independent set*  $S$ .

- Then the path any two vertices  $i, j \in S$  has length at least 2 in  $G$ , say  $i \rightarrow k \rightarrow j$ .
- Therefore, the path between  $i$  and  $j$  in  $G'$  has length at least 3 -- that is,  $i \rightarrow v_{ik} \rightarrow v_{jk} \rightarrow j$ .

This confirms that  $G'$  has a *strongly independent set*.

---

*Only if.* Suppose  $G'$  has a *strongly independent set*  $S'$ . We can swap every "edge" vertex in  $S'$  with a "vertex" vertex such that  $S'$  remains a *strongly independent set* in  $G'$ .

- Formally, if  $v_{ij} \in S'$ , then we delete  $v_{ij}$  and add  $i$  **or**  $j$  to  $S'$ , say  $i$ .
- Suppose the minimum distance to  $v_{ij}$  from  $\forall u \in S' - v_{ij}$  is  $d$ .
- Every path from  $u$  to  $i$  must go through one of the "edge" vertices connected to  $v_{ij}$ , say  $v_{ik}$ .
  - If the path goes through  $v_{ij}$ , then the path length is at least  $d + 1$  (append  $v_{ij} \rightarrow i$ )
  - If the path does not go through  $v_{ij}$ , then the path length is at least  $d$  (change  $v_{ik} \rightarrow v_{ij}$  to  $v_{ik} \rightarrow i$ )

In this way,  $S'$  is still a *strongly independent set* in  $G'$ . Meanwhile, all the "vertex" vertices in  $S'$  are now present in  $S$ ! They constitute an *independent set* in  $G$ . ■
